Project Development Methodology

Agile is selected as the software development methodology for WorkWise. Agile follows an iterative and incremental approach that focuses on flexibility, teamwork, continuous testing, and improvement. WorkWise is a Java-based productivity and well-being management system designed for desktop-based workers.

Agile is suitable for WorkWise because the project includes multiple interconnected features, such as user authentication, task and deadline management, work session tracking, activity monitoring, workload analysis, well-being reminders, alerts, and report generation. These features can be developed and tested in separate modules before integration. The project is being developed by a team of four members, and Agile supports teamwork, task distribution, regular communication, and progress reviews. Moreover, Agile allows the team to modify and improve features based on testing results and feedback when necessary.

Agile follows a repeating cycle of planning, design, development, testing, and review. In WorkWise, the team can apply this cycle to any selected feature. For example, during an iteration, the team plans a feature, designs its structure, implements it using Java, tests its functionality, and reviews the results. Any identified errors or necessary improvements are addressed in subsequent iterations. The same cycle is repeated for other features until the required modules are developed, tested, and integrated into the complete system.

In conclusion, Agile is suitable for WorkWise because it supports modular development, teamwork, flexibility, and continuous improvement. Its iterative approach helps the four-member team develop and refine the Java-based system systematically while addressing the project's requirements.
